Test physiologically relevant ATP yields from different carbon sources for a metabolic model Authoris; less Thiris, Rozas M. T. Rening, LCSR, University of Lessenbourg.

Reviewe(s): INTRODUCTION

In this studied, we show how to comprise the ATP yield from different carbon sources under aerobic or anaerobic conditions. The theoretical values for the corresponding ATP piecis are also provided. The studie can be adapted for Record 3 derived conditions and cell-tipe specific models to set whether these models are set all also spondering physiologically repent ATP yields.

EQUIPMENT SETUP If necessary, initialize the cobra toolbox with

For solving linear programming problems in FBA analysis, certain solvers are required

For solving linear programming problems in FBA and change(obrasio)ver ("slot", "all", 1);

changeCobradolver ('glpk', 'sll', 1);

> between for LF problems has been set to > between for MELF problems has been set to to be an arm of the problems for problems and the problems and the problems are properties.

This state discrete to an wife aggregation place is loser programming solver, which does not impair additional installation and configuration. Netwerk, for the analysis collection of the process of the

Seture proceeding with the simulations, the path for the model needs to be set up: model FalleName = "Recond, model_mat"s

modelEncourty = getExtrinatedMeshplace(monifilmanes), which up the filer for the distributed Meddit.

modelFilmane: Beablingsrept principles amodelFilmanes) by der the full path. Recently to be save, that the right model is Loaded model = realthmodel(monifilmanes) and = realthmodel(mon

In this saturial, the used model is the generic model of human metabolism, Recon \mathbf{S}^1 or Recond.0 model.

The metabolites structures and reactions are from the Virtual Metabolic Human distabase (VMH, <u>http://www.life/</u> Harmonization of abbreviation usage

First, we will harmonize different bracket types used in different model versions, e.g., different version of the human metabolic reconstru-

model.rxms = regexprep(sodel.rxms, "\(', "\('));
sodel.rxms = regexprep(sodel.rxms, "\(', "\('));
sodel.sets = regexprep(sodel.sets, "\(', "\('));

Reconduces ATPSintmi instead of <u>ATPSitm</u> as an abbreviation for the AT application in reconstruction of the ATPSitm as an abbreviation for the ATPSitm (Inc.) (ATPSitm) (Inc.)

Similarly, the glucose exchange reaction has been updated:

if lenesth(streacch('sx slc(e)', model,ress))od

model.nns(find(innesber(model.nns, 'El_glc(e)'))) = 'El_glc(b(e)';
and

Add ATP hydrolysis reaction to the model. If the reaction exist already, nothing will be added by the vanitive Lens variable will contain the index of the rest that is present in the model. In this case, we will rename the reaction abbreviation to ensure that the sacrial works correctly.

[model, ranifewritt] = addReartice(model, 'DM_atp_C_', 'NDE(c) + atp[c] \rightarrow adp(c) + b[c] + pI[c] ');

Moretage Reaction with the same name already exists in the modupolating the reaction $D(_{i}x|g_{i}c_{i}, Nx_{i}c_{i}) + ax_{i}(c_{i}) \rightarrow ay_{i}(c_{i}) + h(c_{i}) + g_{i}(c_{i})$

if beggth(randbecists) > d
 model.name(randbecists) = "DM_Atg_C_"; % remane reaction in case that it exists already

Diose model

United modes!

Now, we will set the lower bound (humber 1, tar) of all exchange and sink (sighters) reactions to ensure that only those metabolites that are supposed to be taken up was introduce uncoded to the amonds.

First, we will find all mactions based on their abbreviation (model.rune)

andelClosed = model;

modelschanger1 = streatch('is' '. modelsClosed.runs);
